Got it — you need a **copy-paste-proof, skill-revealing, and originality-forced** 2-hour task.

Here is a **much harder, unique, scenario-based full-stack intern task** that **cannot be copied** because it requires custom logic, thinking, and building something unusual.

FULL-STACK INTERN ORIGINALITY TASK (2-HOUR LIMIT)

Title: "Mini Audit Trail Generator"

Problem Scenario

Build a **micro web app** where a user enters any text **and the system automatically generates a change-history audit trail** every time the text is modified.

This forces:

- frontend + backend interaction
- custom logic
- state management
- timestamps
- no template exists online

TASK REQUIREMENTS

1. UI (React / Next.js)

A single page with:

- A text area: **"Content Editor"**
- A button: **"Save Version"**
- A panel/list: **"Version History"**

2. Functionality

When user edits the text and clicks **Save Version**, the backend must:

- Detect difference between the previous and new text
- Store:

Example version entry:

```
{
  id: "uuid",
  timestamp: "2025-11-26 13:40",
  addedWords: ["adoption", "dashboard"],
  removedWords: ["pilot"],
  oldLength: 43,
  newLength: 51
}
```

3. Backend (Node.js / Express / Next.js API)

Must implement:

- POST /save-version
- GET /versions

Backend Logic Required

Candidate must write custom logic for:

- Extracting added words
- Extracting removed words
- Counting word changes
- Generating a summary object

There is no copy-paste answer online.

4. Data Storage

Choose any:

- JSON file
- SQLite
- In-memory array (acceptable for 2 hours)

5. Deployment

- Deploy frontend + backend (Vercel / Render / Railway)
- Submit:

EVALUATION CRITERIA

- Ability to design a small system
- Ability to write custom logic (diff algorithm)
- Clean folder structure
- Working deployment
- Use of timestamps, UUID, etc.
- Approaches to problem solving
- Readable code + comments
